ABSTRACT:

Yonikanda is a disease of vulva or lower vaginal canal. In this disease resemblance with pus or blood is basic clinical features hence it can be equated with bartholin abscess. Vataja yonikanda can be considered early stage of bartholin abscess, Pittaj yonikanda as acute suppuration stage, Kaphaj yonikanda as chronic stage and Sannipataja yonikanda as acute suppuration in chronic Bartholin’s abscess. Bartholin’s abscess can occur at any age, however, it is more common in women of reproductive age group are more vulnerable. Here we present a case of a 40 year old female patient, with recurrent development of Bartholin’s gland abscess. In such condition modern science suggest marsupialization, incision and drainage surgery. In Bhavaprakasha samhita yoga is mentioned namely Aamrashti yoga for treating yonikanda.

Keywords: Yonikanda, Bartholin’s abscess, Marsupialization, Aamrashti yoga

INTRODUCTION

Yonikanda is a disease of vulva or lower vaginal canal has round or irregular shape. There are four types of Yonikanda mentioned in ayurvedic text-Vataj, Pittaj, Kaphaj, Sannipataj. In this disease resemblance with pus or blood is basic clinical features hence it can be equated with bartholin’s abscess. Vataja yonikanda can be considered early stage of Bartholin abscess, Pittaj yonikanda as acute suppuration stage, Kaphaj yonikanda as chronic stage and Sannipataja yonikanda as acute suppuration in chronic Bartholin’s abscess. Bartholin glands are situated at 4 O’clock and 8 O’clock position in the superficial perineal pouch, close to the posterior end of the vestibular bulb. They are pea shaped and about 0.5 cm. Each gland has got a duct measuring 2 cm. They are similar to Cowper’s glands in male. In bartholin’s abscess the duct gets blocked by fibrosis and the exudates pent up inside to
produce abscess. If left untreated the abscess may burst through the lower vaginal wall. Purulent discharges are seen after bursting of abscess and incision of abscess advised for other abscesses are not mentioned for this disease in ayurvedic classics. In modern text use of antibiotics, incision and drainage, marsupialization is advised for this condition. But as the recurrence rate is high Bartholin’s gland abscess can be treated successfully by the use of Aamrashti yoga.

**CASE PRESENTATION**

A 40 year old female patient presented to the gynecology OPD at Government Ayurved College, Nanded with a history of painful huge swelling in her right labia majora form 15 days which initially started as a small swelling, then increased in size and become painful. She gave history of vaginal discharge and due to persistent swelling inability to walk properly. She had taken treatment in private hospital 5-6 days before for this but did not get relief. She had history of same before 1 year and was treated through suction with needle syringe though she noted temporary relief along with use of long term antibiotics.

Patient was married since 22 years. Her obstetric history was G4P4A0L4D0, all FTND at home. On examination there was a tender large mass involving right labia majora, shiny and smooth surface, and hard consistency with no punctum and measuring 7.5 cm in length and 5 cm in width. Her vaginal examination revealed normal vaginal wall, scanty purulent vaginal discharge, with normal cervix and normal sized uterus. There were no adnexal mass or tender fornices. Samanya parikshan shows - Nadi -82 beats per minutes, Mala -Constipation, H/O passing hard stool, bleeding during defecation, Mutra-Prakrut, Jivha-Saam, Shabda-Prakrut, Sparsh-Ushna, Druk-Panduta, Akriti-fatty patient. On general examination she had no peripheral lymph node enlargement. Her vital signs were blood pressure of 130/80 mmHg and temperature 98.9°F.Cardiovascular system examination revealed audible first and second heart sounds and no murmurs or added sounds. Respiratory system examination showed respiratory rate 20 breaths per minute, normal chest contour, normal chest expansion, and normal breath sounds on auscultation. Per abdominal examination shows fatty, soft, non-
tender abdomen. The liver and spleen were not palpable. Bowel sounds were normal on auscultation. Srotas parikshan shows Pranavaha, Mansavaha, Asthivaha, Majjavaha srotasa’s were normal, Udakvaha srotas shows Pipasaatimatram, Annavaha srotas- Anannabhilasha, hrullas, Rasavahasrotas-aruchi, panduta, Raktavahasrotas-Vidradhi, Medovahasrotas-Atisveda, atisthulata.

The patient was counseled for treatment. Blood investigations of the patient were carried out- 
1. CBC -Hb% -11.9gm%, WBC-11,000/cmm, Platelets- 2,87,000/cmm 
2. HIV-Non-reactive 
3. HBsAg- Non-reactive 
4. VDRL- Non-reactive 
5. Blood Group- O Positive 
6. Random blood sugar level – 100mg%.

The differential diagnosis includes Bartholin cyst, perineal abscess, Recto vaginal fistula, haematoma, lipoma, infected lymphangioma.

Aamrashthi yoga (Bhavprakasha samhita/chikitsa sthan/70/62) was given to the patient orally as well as local application of the drug was done over the early stage of the Bartholin’s gland abscess. The vagina is filled with powdered red orchre, kernel of mango, rajani, anjana, and katphala mixed with honey and also it was given orally for 3 days twice a day. Along with this Kanchanar guggul 2 tablets BD, Gandh rasayana 2 tablets BD, sukshma triphala 2 tablets BD, Arogyavardhinivati 2 tablets BD were given. Within 3 days the abscess burst out by itself with releasing purulent discharge from it. The abscess was then opened up and complete drainage was done. After that for again 3 days the local application of drug was done. Patient also got relief from pain and discomfort. The patient was re-evaluated again after 1 week. She was clinically well and on examination swelling, tenderness had resolved. Follow up 6 months later showed no recurrence or any labial abnormality.

DISCUSSION
Bartholin’s glands main function is to provide lubrication for sexual intercourse. They secret colourless, mucoid discharge on sexual excitation which moisturizes the vestibule. A Bartholin’s gland cyst is a cystic enlargement of the gland. An obstruction to the Bartholin’s duct leads to stasis of secretion, dilatation of the gland and cyst formation. The cyst may get infected forming an abscess. In our case, the patient presented with history of recurrent right huge labial swelling. The nidana for this condition is Nonvegetarian diet (ghosh) weekly 3-4 times, oily and spicy food frequently, Local unhygiene, Excess sweating, Day sleeping, Fatty Patient, Constipation. Hetu sevan Tridosha dushti Rakta, Maansa, Med dushti Yonisthani sthaansanshraya Yonikanda utpatti. Application of lepa and oral consumption of drug is the first step of management of abscess for Paka. Further the abscess brust out with release of all pus. The drugs used in this yoga are mostly katu, tikta, kashaya rasatmak, usha virya and kaphavatashamak in properties. Kataphla consist of myricanol, aproanthocyanidin, sitosterol which is anti-inflammatory action, reduces edema also it is antioxidant in nature. Kernel of mango (aamrasthi) consist sitosterol, tocopherol which has antibacterial, antioxidant properties thus prevent infection. Gairika (Red Ochre) a silicate of Alumina is dahashamaak, pitta, kapha shāmak, purifies blood. Its cooling property gives relief in abscess. It is Madhura and Kashaya, Shit virya, vran ropak, balya in properties. Turmeric is anti-inflammatory, analgesic, antiseptic, antibacterial, antiparasitic in action and also boost immunity. It has beneficial effect for ras and rakta dhatus, it reduces kapha and ama. Rasanjana is katu and kashaya rasatmak, usha virya, kapha pitta shamaka. It reduces Inflammation or edema, removes pain, blood purifier, haemostatic in action.

A huge Yonikanda (early stage of Bartholin’s gland abscess) as the case in this patient and giving multiple antibiotics with incision and drainage alone may generally not solve the issue of recurrent Bartholin’s gland
abscess. The use of *Aamrasthi yoga* orally and locally has been shown to be successful, on the progressive follow up of the patient. However, additional use of *Kanchanar guggul*, *Gandhak rasayana*, *sukshma triphala*, *Aarogyavardhinivati* has also shown to support the improvement of the disease.

**CONCLUSION**

*Yonikanda* should be distinguished from other vulval masses. A simple management by use of *Aamrasthi yoga* orally and locally has been proved effective rather than management by marsupialization or surgical incision and drainage. Further such cases can be studied in large population to assess the effectiveness of Ayurvedic treatment.
