ABSTRACT:

Uterine fibroid, a noncancerous growth of the uterus that often appear during childbearing age of female and also known as fibromyomas, leiomyomas or myomas, is one such gynecological disorder which is posing a major health problem. A 45-year-old female patient approached the outpatient department with complaints of menorrhagia and abdominal pain. Ultrasound scan revealed small posterior wall intramural fibroid measuring 1.5*1.0cms. She was suggested hysterectomy for the same; however, the patient was not willing to undergo surgery. She was treated as per the Ayurvedic line of treatment of asrugdhara & Granthi which is correlated to Menorrhagia (presenting complaint) & growth. She was administered Asokarishta, Varunadi kashayam and Kanchanara Guggulu tablets available in the Outpatient department. Treatment was continued for 3 months with a follow up once in 15 days and a repeat scan revealed shrinking size of the fibroid and relief in symptoms. A follow up scan also revealed that the fibroids had disappeared. During the treatment period patient has not reported any negative effects concerning the progression of disease nor regarding the medicines. An attempt has been made to present the successful management of fibroid with non-hormonal medicines in a patient. An Ayurvedic medicine regarding the safe, noninvasive, non-hormonal cost-effective management of fibroids through Ayurvedic interventions.

Keywords: Asrugdhara, fibroid, uterine fibroid, Granthi

INTRODUCTION

Fibroids occur in 20-40% of women during reproductive age and 11-19% in perimenopausal age.¹ They are clinically apparent in up to 25% of women and cause significant morbidity, including prolonged or heavy menstrual bleeding, pelvic pressure or pain, and, in rare cases, reproductive dysfunction.² Women experience distress and impaired work productivity due to fibroid. There are many women undiagnosed with significant symptoms emphasizing the need for improved...
AYURVEDIC MANAGEMENT OF UTERINE FIBROID: A CASE STUDY

awareness and management of fibroids. The clinical effects are related to their local mass effect, resulting in pressure upon adjacent organs, excessive uterine bleeding, or problems related to pregnancy, including infertility and repetitive loss of pregnancy. As a consequence of these local pressure effects and bleeding, uterine fibroids rank as a major reason for hysterectomy accounting for approximately one-third of all hysterectomies or about 2,00,000 hysterectomies/year. Fibroids are of unicellular origin and possess a distinct autonomy from their surrounding myometrium because of their outer connective tissue layer which allows leiomyomas to be easily “shelled out” of the uterus during surgery. Localized nodular swelling/growth has been referred under the name called Granthi. Etiopathogenesis, clinical features and treatment of Granthis, are identical to the Granthis of any other body part, however few clinical features present due to a specific location of the disease as a result of anatomical and physiological disturbance. Granthi when present in yoni (female reproductive system)/Garbhashaya (uterus) will lead to disturbed menstrual cycle-menorrhagia, metrorrhagia, dysmenorrhea, etc. On per vaginal examination, bulky uterus is felt. Removal of the uterus is unacceptable to women desirous of (further) child bearing though it offers a definitive solution to the problem. Newer procedures for fibroid removal may relieve symptoms, but duration of symptom relief and efficacy of the procedures in restoring fertility have not been evaluated. Such procedures include High-intensity focused sonography, Cryotherapy, Radiofrequency ablation, Magnetic resonance-guided focused ultrasound surgery; Anti-hormonal drugs like progestin or danazol block estrogen to treat fibroids. Uterine fibroid embolization (UFE) gonadotrophin-
releasing hormone (GnRH) agonists and selective progesterone receptor modulators are some of the other treatment options for fibroid. While oral contraceptive pills have been used to treat fibroid related symptoms such as bleeding and dysmenorrhoea, their effect is usually based on their suppression/regulation of the menstrual cycle. The effect of ethinyl – estrogen/progesterone containing pills on myoma growth is less clear. Mirena, is one of the widely used levonorgestrel intrauterine devices, most commonly used in fibroid. Even though the bleeding and dysmenorrhoea-related symptoms are treated, the actual myoma size remains largely unchanged.⁸

The condition of uterine fibroid is similar to Garbhashayagatagranthi, mentioned in Ayurveda with vitiated vata affecting mamsa(muscle tissue), rakta (blood) and medas (fat) mixed with kapha producing rounded, protuberant, knotty and hard swelling. Fibroids can be related to the “Granthi” mentioned in Ayurvedic texts, and it can be managed according to the principle of SampraptiVighatana.

Case study

A 45-year-old female patient, a worker, reported to the outpatient department of Sanjeevini Ayurveda Medical and Hospital on 2nd July 2019 with complaints of abdominal pain and painful heavy menstrual bleeding since 1 year. She gave a history of irregular, heavy flow for 7 to 8 days during each menstrual cycle. She was gravida 2, was nonvegetarian & had a normal active lifestyle. She was diagnosed as having Fibroid from the report on 3rd July 2019 and was advised hysterectomy. No other systemic complaints or family history related to this condition were significant.

Clinical findings
General examination (Rogi Pariksha)

All vitals were stable on examination and it was assessed that the patient belonged to vata-pittajaprakruti. Per abdomen examination revealed that abdomen was soft, tender and no organomegaly was detected.

Investigation

Ultrasound scan of Abdomen & Pelvis revealed that uterus was anteverted size measuring 7.9*4.0*4.8 cms and showed a small hypoechoic lesion intramural posterior wall fibroid measuring 1.5*1.0cms. Haemoglobin-9gm%, ESR- 15mm/dl

Diagnosis

The clinical features along with the ultrasound scan report suggests that it is case of Intramural fibroid and was diagnosed as Garbhashayagata(intrauterine) Granthi(encapsulated growth). Based on the symptoms, it was treated on the lines of Pradara (Menorrhagia) and Granthi.

Therapeutic interventions

Based on Ayurvedic line of management of Asrigdhara (menorrhagia) & Granthi (tumour) and the clinical experience, we formulated the line of treatment from medicines available at OPD. She was advised the following medicines for a period of 3months to observe changes in the menstrual cycle and Size of fibroid. The treatment was scheduled for 3months with a follow up once in 15days.

**DISCUSSION**

In the *Samprati* (pathogenesis) of *Granthi*, it is mentioned that *Mamsa* (muscle fibers) *Rakta* and *Medo Dhatu* are vitiated. Several studies have found an association between obesity and an increased incidence of uterine leiomyomas. The management of fibroids is undergoing an important evolution, with the focus on patient’s quality of life. Spies et al.7 showed that symptomatic uterine fibroids can have a negative impact on health related quality of life (HRQL) through impairment of daily activities and anxiety, which may develop before and after diagnosis. Patients report psychological distress, helplessness in dealing with the diagnosis and treatment options, negative body image, effects on sexuality and a lack of support.11

Accordingly, surgical techniques and aggressive treatments are reserved for only those cases with heavy symptomatology, while the clinical diagnosis based on size and number of fibroids remains in a second plane in this situations.12

In this case the patient opted for Ayurvedic treatment instead of surgery as hysterectomy would have long term complications like osteoporosis etc. According to Ayurveda, Uterine fibroid is considered as *Garbhashayagata* (intrauterine) *Granthi*(encapsulated growth). The symptoms are similar to the condition “pradara” which is menorrhagia. Treatment was aimed at reduction of symptoms of menorrhagia as well as treating the fibroid. It is based on the Ayurvedic principles of karyakaranabhava (Cause and effect theory). When the effect is treated, it should have an impact on its causative factors also. It has been observed that fibroids have fully disappeared by the end of 3 months of treatment.

Ashokarishta, is a popular Ayurvedic medicine mentioned in the classical text BhaishajyaRatnavali in the
context of Streeroga (Gynecology). It is extensively used in the condition Pradara/Raktapradara/Asrakdhara (as mentioned in Ayurveda) which is characterized by qualitative and quantitative increase in flow of menstrual bleeding. It mainly contains medicinal plants like Ashoka (Saracaindica Linn), Amalaki (EmblcaofficinalisGaerth), Bibhitaki (Terminalia bellerica), Jeeraka (Cumimumcuminmin Linn), Haritaki (Terminaliachebula Retz.), Shunti (Zingiberofficinalis Rosc), Amra (Mangiferaindica Linn), Vasa (Adhatodavasica), Chandana (Santalum album), Daruharidra (Berberisaristata DC), Dhataki (Woodfordiafruiticosa (L.) KURZ), Musta (Cyprus rotundus Linn), Kamala (Nymphaea nouchali BURM. F.), and Guda (Jaggery). It contains 5–10% of self-generated alcohol, which acts as a medium for herbal active principles. Ashoka contains mainly tannins, saponins, β-sitosterol and exhibits antioxidant, anti-inflammatory activities, hence indicated in Uterine bleeding. It has both antioxidant and Hematoprotective potentials which is essentially needed for management of menorrhagia. Ashoka bark contains phenol glycoside which has direct effect on uterine musculature. It stimulates both endometrium and ovarian tissue. It decreases blood flow and tones up the endometrial vascularity and thus, checks excessive bleeding.13

If we see the contents of the drugs; Guggulu (Commiphoramukul Hook. ex Stocks.) is analgesic and anti-inflammatory. Guggulu possesses Laghu (light), Ruksha (dry), Tikshna (sharp), Vishad (clear), Sara (mobile), Dipana (stomachic) enkindle the digestive fire), Anuloman, Lekhana (scraping), Medohara. KanchanaraGuggulu is a classical Ayurvedic formulation, used for Kapha accumulations in the tissues. As Kapha moves deeper within the system, it may manifest as swollen lymph nodes, cysts or growths. Powerful decongestants such as Kanchanara, Triphala (a combination of fruits of Terminalia chebula Retz., Terminalia bellerica Roxb., and E. officinalis), and Trikatu (Zingiberofficinalis Rosc., Piper nigrum L. and Piper longum L.) are mixed with Guggulu to break down and eliminate hardened Kapha. This
detoxifying blend supports the proper function of the lymphatic drainage and digestive systems, aiding in the prevention of further *Kapha* accumulation. Its main ingredients *Kanchanara* (*Bauhinia variegate* L.), *Varuna* (*Crataevanurvala* Buch.-Ham.), *Triphala*, *Trikatu*, *Trijataka* may also be useful in hypothyroidism. *Kanchanara* *Guggulu* supports proper function of the lymphatic system, balances *Kapha Dosha*, promotes elimination of inflammatory toxins; it is alterative, anti-inflammatory and tonic and is administered in cysts, malignant ulcers, syphilis, fistula, scrofula, sinus, etc., *Kanchanara* is very useful in extra growth or tumors and helps in reducing bleeding.14

**CONCLUSION**

Surgical intervention need not be the only management for uterine fibroids. This case illustrates a situation where methodical Ayurvedic intervention can not only help in relieving symptoms but also restores normal life of the women and avoid further complications and successful management.
